VEGA Server Cluster

SKU: V4090-8002

VEGA Control System

- Allows VEGA Server to operate in a cluster
- Supports an unlimited number of PC/VM server instances per studio

PRODUCT DESCRIPTION

VEGA Server Cluster enables the server to be installed as a cluster, distributing the control system services across multiple pieces of hardware. One license is required per server cluster, with no limit to how many PCs/VMs the server cluster is distributed across for a single studio. Creating a cluster of servers in this way distributes the workload and management to offer resilience through failover support and capacity via load-distribution. Global facilities can locate individual but connected servers close to each production location for a truly geographically distributed system.
